Abstract

invention discloses method for directly separating and purifying polyhydroxyalkanoates in cells from fermentation liquid and it relates to the field of posttreatment technology of biological engineering. The method includes following steps: pretreating fermentation liquid with physical method for breaking cell wall; adjusting pH value of pretreated fermentation liquid to alkaline; adding anionic surfactant; reacting under agitation; separating and extracting coagulated precipitate from reaction liquid; washing and drying. The invention has the advantage of simple technology, low cost, high extraction yield and no pollution, and large scale industrialized production can be realized.
